

## Assignment 4b (Evaluation Q.)

1. Define the distance between two (nonempty) sets  $A$  and  $B$  in  $M$  by
$$d(A, B) = \inf \{ d(a, b) \mid a \in A, b \in B \}.$$
Give an example of  $A, B$  s.t.  $A$  and  $B$  are disjoint closed sets in  $\mathbb{R}^2$  with  $d(A, B) = 0$ .
2. Let  $A \subset M$ . A point  $x \in M$  is called a limit point of  $A$  if every nghd of  $x$  contains a point of  $A$  that is different from  $x$  itself, i.e., if  $\forall \varepsilon > 0, \exists B(x, \varepsilon)$  s.t.
$$B(x, \varepsilon) \setminus \{x\} \cap A \neq \emptyset.$$
If  $x$  is a limit point of  $A$ , show that every nghd of  $x$  contains infinitely many points of  $A$ .
3. Show that  $x$  is a limit point of  $A$  iff  $\exists$  a seq.  $(x_n)$  in  $A$  s.t.  $x_n \rightarrow x$  and  $x_n \neq x \ \forall n \geq 1$ .
4. Let  $A'$  be the set of limit pts. of a set  $A$ . Show that  $A'$  is closed and  $\overline{A} = A' \cup A$ . Show that  $A' \subset A$  iff  $A$  is closed.
5. Prove the Bolzano-Weierstrass Thm: Every bdd infinite subset of  $\mathbb{R}$  has a limit point.
6. A set  $P$  is called perfect if it is empty or if it is a closed set and every point of  $P$  is a limit point of  $P$ . Show that a nonempty perfect subset  $P$  of  $\mathbb{R}$  is uncountable.
7. If  $x \in A$  and  $x$  is not a limit pt. of  $A$ , then  $x$  is called an isolated pt. of  $A$ . Show that a point  $x \in A$  is an isolated pt. of  $A$  iff  $B(x, \varepsilon) \setminus \{x\} \cap A = \emptyset$  for some  $\varepsilon > 0$ . Prove that a subset of  $\mathbb{R}$  can have at most countably many isolated points, thus showing that every uncountable subset of  $\mathbb{R}$  has a limit pt.

8. A point  $x \in M$  is said to be a boundary pt. of  $A$  if each nghd of  $x$  hits both  $A$  and  $A^c$ . That is,  $B(x, \varepsilon) \cap A \neq \emptyset$  and  $B(x, \varepsilon) \cap A^c \neq \emptyset \quad \forall \varepsilon > 0$ .  
Denote  $\partial A :=$  the set of boundary pts. of  $A$ .

Prove:

- (i)  $\partial A = \partial(A^c)$
- (ii)  $\text{cl}(A) = \partial A \cup A^\circ$  (Recall  $A^\circ$  is the interior of  $A$  &  $\text{cl}(A)$  is the closure of  $A$ .)
- (iii)  $M = A^\circ \cup \partial A \cup (A^c)^\circ$ .

9. Show that  $\partial A$  is always a closed set, in fact,  $\partial A = \text{cl}(A) \setminus A^\circ$ .

10. Show that  $A$  is closed iff  $\partial A \subset A$ .

11. Give examples showing  $\partial A = \emptyset$  and  $\partial A = M$  are both possible.

12. (a) Prove that if  $A$  is open or  $A$  is closed in  $M$ , then  $(\partial A)^\circ = \emptyset$ . (4 pts.)

- (b) Give an example in which  $(\partial A)^\circ = M$ . (1 pt.)

13. A set is said to be dense in  $M$  if  $\text{cl}(A) = M$ .

Show that  $A$  is dense in  $M$  iff any one of them holds:

- (a) Every pt. in  $M$  is the limit of a seq. from  $A$ .

- (b)  $B(x, \varepsilon) \cap A \neq \emptyset \quad \forall x \in M \text{ and } \forall \varepsilon > 0$ .

- (c)  $U \cap A \neq \emptyset$  for every nonempty open set  $U$ .

- (d)  $A^c$  has empty interior, i.e.,  $(A^c)^\circ = \emptyset$ .

14. Let  $G$  be open and let  $D$  be dense in  $M$ .

Show that  $\overline{G \cap D} = \overline{G}$ . Give an example showing that this equality may fail if  $G$  is not open. (Recall notation  $\overline{A} = \text{cl}(A)$ .)

15. A metric space is called separable if it contains a countable dense subset.  
Find examples of countable dense sets in  $\mathbb{R}$ ,  $\mathbb{R}^2$ , in  $\mathbb{R}^n$  for  $n \geq 2$ .
16. Prove that  $(\ell_2, \|\cdot\|_2)$  is separable, but  $(\ell_\infty, \|\cdot\|_\infty)$  is not separable.
17. Show that a separable metric space has at most countably many isolated points.
18. If  $M$  is separable, show that any collection of disjoint open sets in  $M$  is at most countable.
19. A set  $A$  is said to be nowhere dense set if  $(\text{cl}(A))^{\circ} = \emptyset$ .  
Show that  $\{x\}$  is a nowhere dense in  $M$  iff  $x$  is not an isolated pt. in  $M$ .
20. If  $A$  and  $B$  are nowhere dense sets in  $M$ , then prove that  $A \cup B$  is nowhere dense.  
Give an example showing that an infinite union of nowhere dense sets need not be nowhere dense.
